ECE368: Probabilistic Reasoning

Lab 2 – Part I: Bayesian Linear Regression

Name: Seunghyun Cho **Student Number:** 1001681325

You should hand in: 1) A scanned .pdf version of this sheet with your answers (file size should be under 2 MB); 2) four figures for Question 2 and three figures for Question 4 in the .pdf format; and 3) one Python file regression.py that contains your code. All these files should be uploaded to Quercus.

1. Express the posterior distribution $p(\mathbf{a}|x_1, z_1, \ldots, x_N, z_N)$ using $\sigma^2, \beta, x_1, z_1, x_2, z_2, \ldots, x_N, z_N$. (1 **pt**)

$$P(\underline{a}|x_1, z_1, \cdots, x_N, z_N) = N(\mu_{a|x,z}, \Sigma_{a|x,z})$$

$$\mu_{a|x,z} = \left(X^TX + \frac{\sigma^2}{\beta^2}\begin{bmatrix}1 & 0\\ 0 & 1\end{bmatrix}\right)^{-1} X^T Z$$

$$\Sigma_{a|x,z} = \left(X^TX + \frac{\sigma^2}{\beta^2}\begin{bmatrix}1 & 0\\ 0 & 1\end{bmatrix}\right)^{-1}\sigma^2$$

where $X = \begin{bmatrix}1 & x_1\\ \vdots & \vdots\\ 1 & x_N\end{bmatrix}$, $Z = \begin{bmatrix}z_1\\ z_2\\ \vdots\\ z_N\end{bmatrix}$

$$P(\underline{a}) = N\left(\begin{bmatrix}0\\0\end{bmatrix}, \begin{bmatrix}\beta & 0\\ 0 & \beta\end{bmatrix}\right)$$

2. Let $\sigma^2 = 0.1$ and $\beta = 1$. Draw four contour plots corresponding to the distributions $p(\mathbf{a})$, $p(\mathbf{a}|x_1, z_1)$, $p(\mathbf{a}|x_1, z_1, \ldots, x_5, z_5)$, and $p(\mathbf{a}|x_1, z_1, \ldots, x_{100}, z_{100})$. In all contour plots, the x-axis represents a_0, and the y-axis represents a_1. Please save the figures with names **prior.pdf, posterior1.pdf, posterior5.pdf, posterior100.pdf**, respectively. (1.5 **pt**)

3. Suppose that there is a new input x, for which we want to predict the corresponding target value z. Write down the distribution of the prediction z, i.e, $p(z|x, x_1, z_1, \ldots, x_N, z_N)$. (1 **pt**)

$$p(z|x, x_1, z_1, \cdots, x_N, z_N) = N(\mu_{new}, \sigma^2_{new})$$

$$\mu_{new} = (\mu_{a|x,z})\begin{bmatrix}1 & x\end{bmatrix}$$

$$\sigma^2_{new} = \begin{bmatrix}1\\ x\end{bmatrix}(\Sigma_{a|x,z})\begin{bmatrix}1 & x\end{bmatrix} + \sigma^2$$

where $\mu_{a|x,z} = \left(X^TX + \frac{\sigma^2}{\beta^2}\begin{bmatrix}1 & 0\\ 0 & 1\end{bmatrix}\right)^{-1} X^T Z$

and $\Sigma_{a|x,z} = \left(X^TX + \frac{\sigma^2}{\beta^2}\begin{bmatrix}1 & 0\\ 0 & 1\end{bmatrix}\right)^{-1}\sigma^2$

from Question 1.

4. Let $\sigma^2 = 0.1$ and $\beta = 1$. Given a set of new inputs $\{-4, -3.8, \ldots, 3.8, 4\}$, plot three figures, whose x-axis is the input and y-axis is the prediction, corresponding to three cases:
   (a) The predictions are based on one training sample, i.e., based on $p(z|x, x_1, z_1)$.
   (b) The predictions are based on 5 training samples, i.e., based on $p(z|x, x_1, z_1, \ldots, x_5, z_5)$.
   (c) The predictions are based on 100 training samples, i.e., based on $p(z|x, x_1, z_1, \ldots, x_{100}, z_{100})$.

   The range of each figure is set as $[-4, 4] \times [-4, 4]$. Each figure should contain the following three components: 1) the new inputs and the corresponding predicted targets; 2) a vertical interval at each predicted target, indicating the range within one standard deviation; 3) the training sample(s) that are used for the prediction. Use plt.errorbar for 1) and 2); use plt.scatter for 3). Please save the figures with names **predict1.pdf, predict5.pdf, predict100.pdf**, respectively. (1.5 **pt**)
